

# ***Reductivity problem on knot projections***

***by Ayaka Shimizu (NIT, Gunma College)***

***Topology & Computer 2016 in Akita***

***October 30, 2016***

# § 0. Outline

$P$ : a Knot projection

$r(P)$ : the **reductivity** of  $P$

How reduced  $P$  is

Example

$$r\left(\text{Diagram 1}\right)=0 \quad r\left(\text{Diagram 2}\right)=1 \quad r\left(\text{Diagram 3}\right)=2 \quad r\left(\text{Diagram 4}\right)=3$$

Theorem (S.)  $r(P) \leq 4 \quad (\forall P)$

Reductivity problem

$\exists? P$  s.t.  $r(P)=4$

If exists,  
 $P$  should ...?

# Contents

§1. Knot projections

§2. Reductivity

§3. 2-gons & 3-gons

§4. Unavoidable sets

§5. 4-gons ♦♦♦♦ joint work with

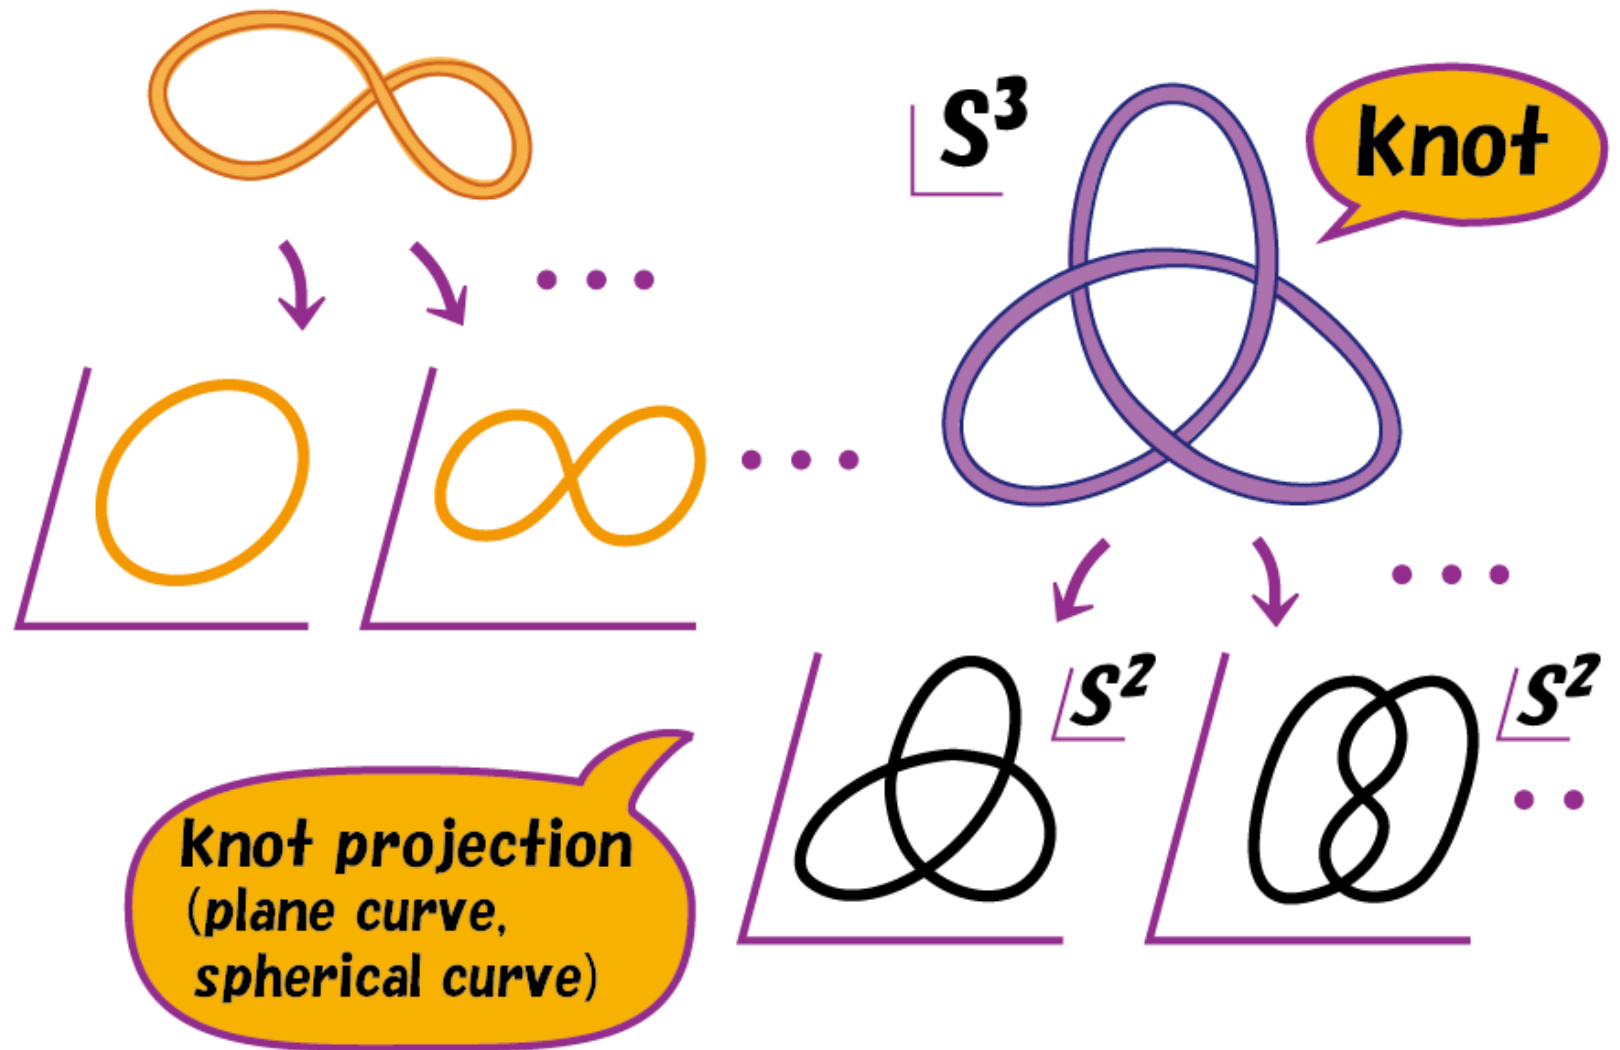

**Yui Onoda**

§6. Future studies

# § 1. *Knot projections*

# Knot projection

**We assume knot projections have at least one crossing.**

# Reducible and reduced

**Knot  
projections**

**reducible knot projections**

**reduced knot projections**

**How reduced are we??**

## § 2. Reductivity

*How reduced?*

*How far from reducible?*

# Inverse-half-twisted splice ( $HS^{-1}$ )

## Example

## Remark

**We can obtain a reducible knot projection from any knot projection by a finite number of  $HS^{-1}$ !**

# Reductivity - how reduced??

## Definition

$P$ : a knot projection

The **reductivity**  $r(P)$  of  $P$  is the minimal number of  $HS^{-1}$  which are needed to obtain a reducible knot projection from  $P$ .

## Example

## Example

$$r \left( \text{Figure 1} \right) = 0$$

$$r \left( \text{Figure 2} \right) = 1$$

$$r \left( \text{Figure 3} \right) = 2$$

$$r \left( \text{Figure 4} \right) = 3$$

## Remark

**There exist infinitely many knot projections  $P$  with  $r(P) = 0, 1, 2,$  and  $3$ .**

# Reductivity is four or less

## Theorem 1 (S)

$$r(P) \leq 4 \quad (\forall P)$$

Reductivity problem

$$\exists? P \text{ s.t. } r(P) = 4$$

**Reference:** A. Shimizu, The reductivity of spherical curves, *Topology and its Applications* 196 (2015).

## § 3. 2-gons & 3-gons

Some types of regions tell us  
upper bounds of conductivity

# 2-gons (bigons) & 3-gons (trigons)

There are two types of 2-gons:

incoherent  
2-gon

coherent  
2-gon

There are four types of 3-gons:

type A

type B

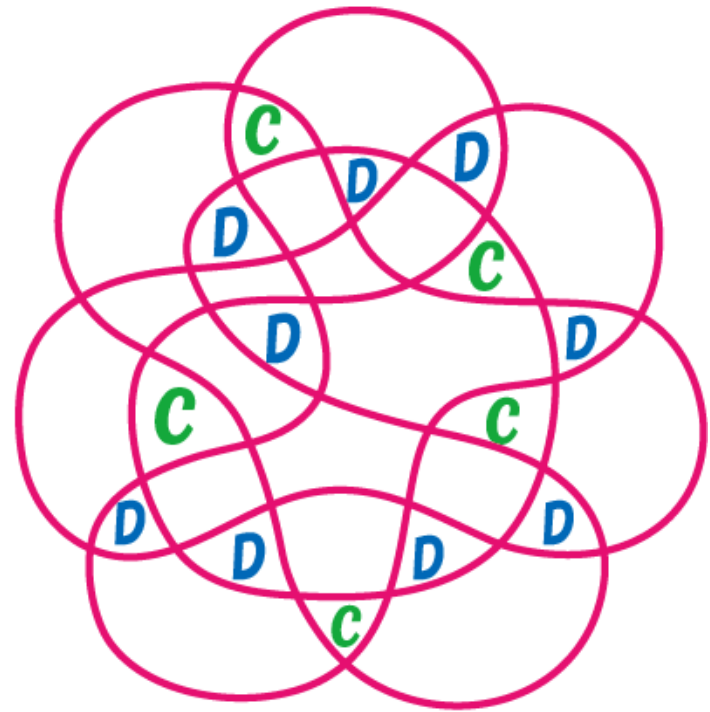

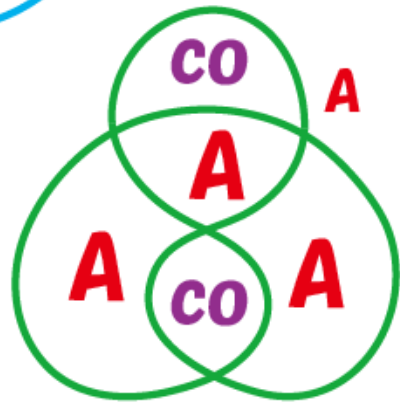

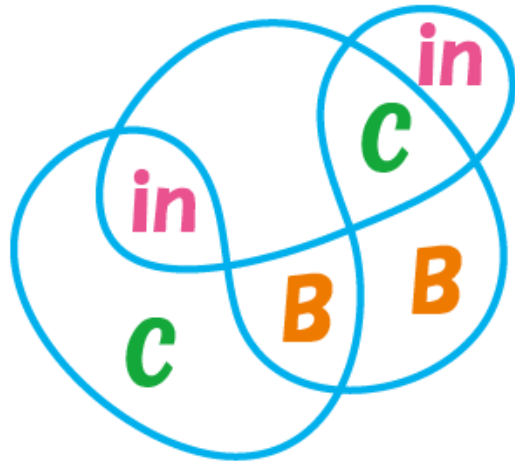

type C

type D

# 2-gons & 3-gons

incoherent  
2-gon

coherent  
2-gon

type A

type B

type C

type D

# 2-gons

## Proposition 2

If  $P$  has an incoherent 2-gon, then  $r(P) \leq 1$ .

If  $P$  has a coherent 2-gon, then  $r(P) \leq 2$ .

# 3-gons

## Proposition 3

If  $P$  has a **3-gon of type A**, then  $r(P) \leq 2$ .

If  $P$  has a **3-gon of type B**, then  $r(P) \leq 3$ .

If  $P$  has a **3-gon of type C**, then  $r(P) \leq 3$ .

If  $P$  has a **3-gon of type D**, then  $r(P) \leq 4$ .

## § 4. Unavoidable sets

Every reduced knot projection must have

one of the parts  $\rho$ ,  $\phi$ ,  $\times$ ,  $\#$ ,  $\otimes$

# AST's theorem

**Theorem (Adams–Shinjo–Tanaka)**

**Every reduced knot projection has 2-gon or 3-gon.**

i.e.,  $\left\{ \text{⌀}, \text{X} \right\}$  is an **unavoidable set** for a reduced knot projection.

**Reference:** C. C. Adams, R. Shinjo and K. Tanaka, Complementary regions of knot and link diagrams, *Ann. Comb.* **15** (2011), 549–563.

# Proof of AST's theorem

**P**: a reduced knot projection

**C<sub>n</sub>**: the number of n-gons of P

Euler's characteristic

$$v - e + f = 2$$

$$\sum_k \frac{k}{4} C_k$$

$$\sum_k \frac{k}{2} C_k$$

$$\sum_k C_k$$

$$\rightarrow 2C_2 + C_3 = 8 + C_5 + 2C_6 + 3C_7 + \dots$$

# **Proof of Theorem 1** (reductivity is four or less)

**If  $P$  is reducible, then  $r(P)=0$ .**

**(by definition)**

**If  $P$  is reduced,  $P$  has a **2-gon** or **3-gon**.**

**(by AST's theorem)**

**If  $P$  has a **2-gon**, then  $r(P) \leq 2$ .**

**(by Proposition 2)**

**If  $P$  has a **3-gon**, then  $r(P) \leq 4$ .**

**(by Proposition 3)**

# Unavoidable sets

By  $2C_2 + C_3 = 8 + C_5 + 2C_6 + 3C_7 + \dots$

and the “**discharging method**”,  
we have:

from graph theory  
(four color theorem)

## Proposition 4

$\{ \text{empty set}, \text{circle}, \text{two parallel lines}, \text{circle with two parallel lines}, \text{two parallel lines with two parallel lines} \}$

$\{ \text{empty set}, \text{circle}, \text{circle with two parallel lines}, \text{two parallel lines with two parallel lines} \}$

$\{ \text{empty set}, \text{two parallel lines}, \text{two parallel lines with two parallel lines}, \text{circle with two parallel lines} \}$

are unavoidable sets  
for a reduced knot  
projection.

# § 5. 4-gons

# 4-gons

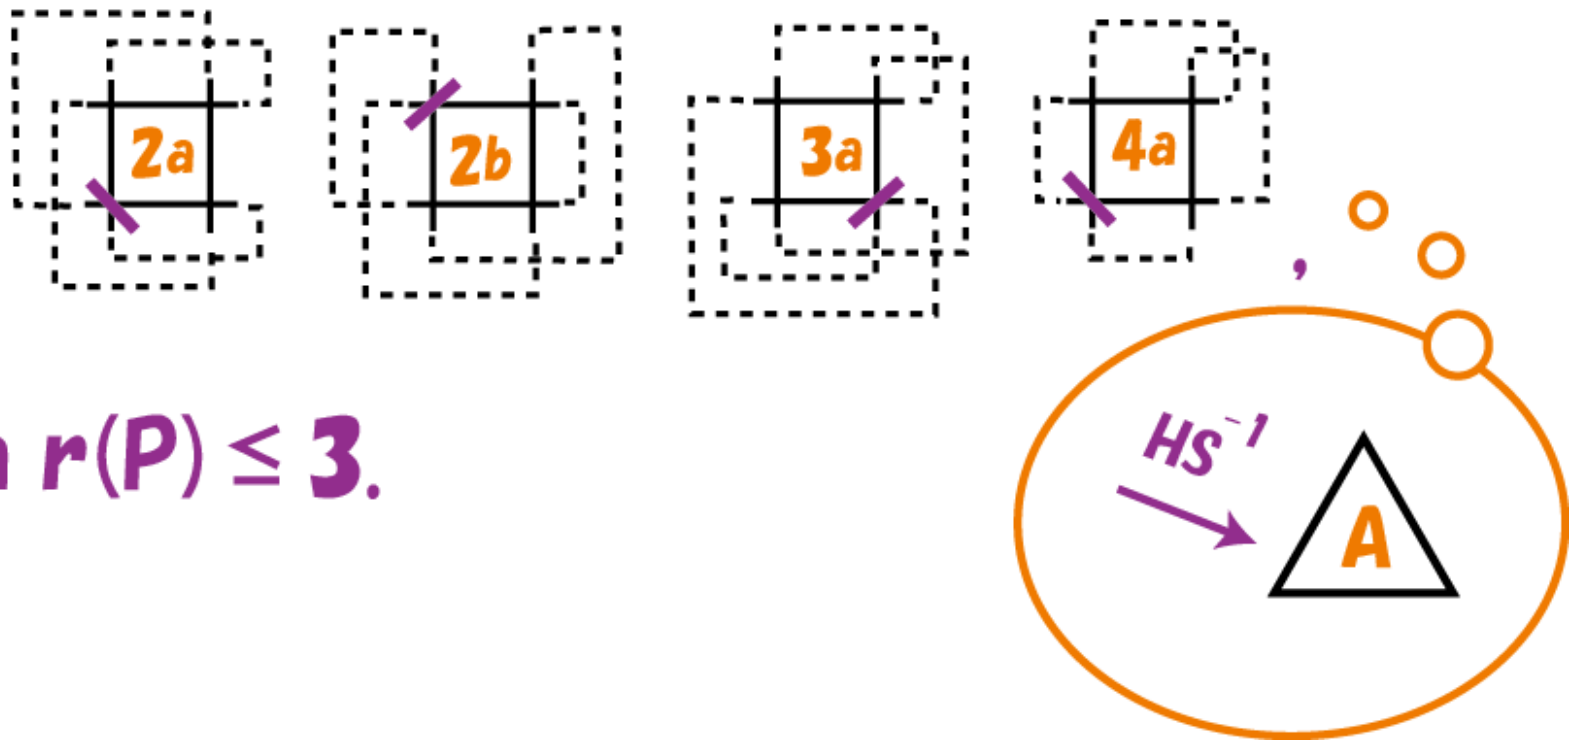

There are **13** types of 4-gons:

## Proposition 5 (Onoda-S)

If a knot projection  $P$  has one of

then  $r(P) \leq 3$ .

# Unavoidable set for $P$ with $r(P)=4$

## Theorem 6 (Onoda-S)

**is an unavoidable set for a knot projection with reductivity four.**

**Reference:** Y. Onoda and A. Shimizu, *The reductivity of spherical curves Part II: 4-gons*, preprint (arXiv:1603.07811).

# § 6. *Future studies*

# ***Future studies***

***Create a knot projection  $P$  such that  $r(P)=4$  (?) using parts of unavoidable sets.***

***(We need more unavoidable sets..)***

***Classify 5-gons and get another unavoidable set for  $P$  s.t.  $r(P)=4$  using chord diagrams and computer.***

**Thank you**  
***for listening!***
